

Demo Video Script

Before you hit record

- docker compose up -d running, bot shows online in Slack
 - Google Sheet open (with previous test data visible -- shows it actually works)
 - Gmail open (send 1-2 fresh test invoices, mark them unread)
 - Slack channel open
-

On camera

1. The problem (20s)

"Businesses receive invoices. Someone manually enters data, checks for duplicates, chases approvals. I built an AI agent to do this -- but safely."

2. The architecture (30s)

Show Docker Desktop: two containers. "AI runs entirely on this machine -- invoices never leave. The agent is sandboxed, can't touch your files."

3. Trigger (10s)

Type process invoices in Slack. "I can also schedule this weekly -- but let's trigger it now."

4. Watch the analysis (30s)

Show the terminal logs briefly. Agent reads the PDF, checks for duplicates, reasons about urgency and amount.

5. The approval message (45s -- key moment)

"The agent hasn't done anything yet. It's asking permission." Read the proposed actions aloud. Point out the email recipient on the urgent reminder -- "notice it got this wrong -- it used the vendor's email instead of our finance team. That's exactly why we have this approval step." Click Skip on it. Approve the rest.

6. Results (20s)

Check the Google Sheet (new row). Check Gmail sent (one email, not two). "It only did what I approved."

7. Close (20s)

"Local AI, sandboxed container, nothing executes without a human click. The tutorial is in the description."
